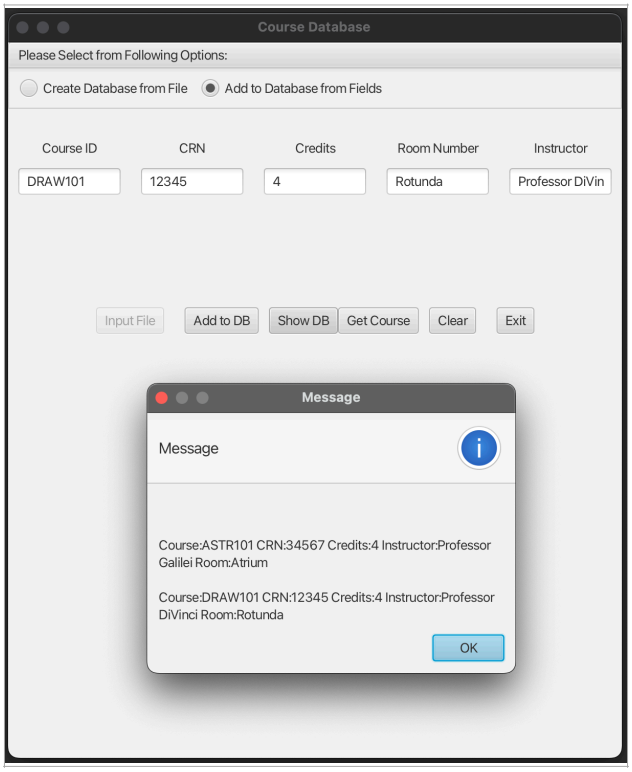
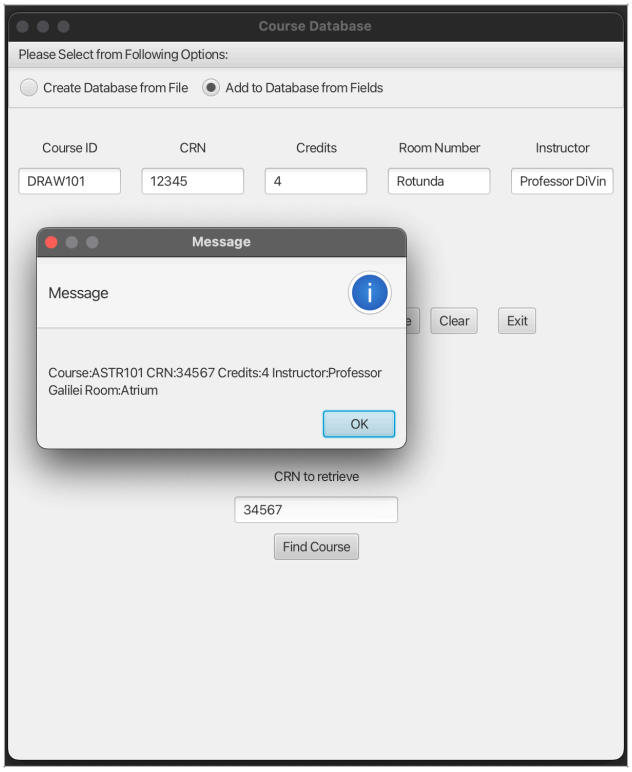
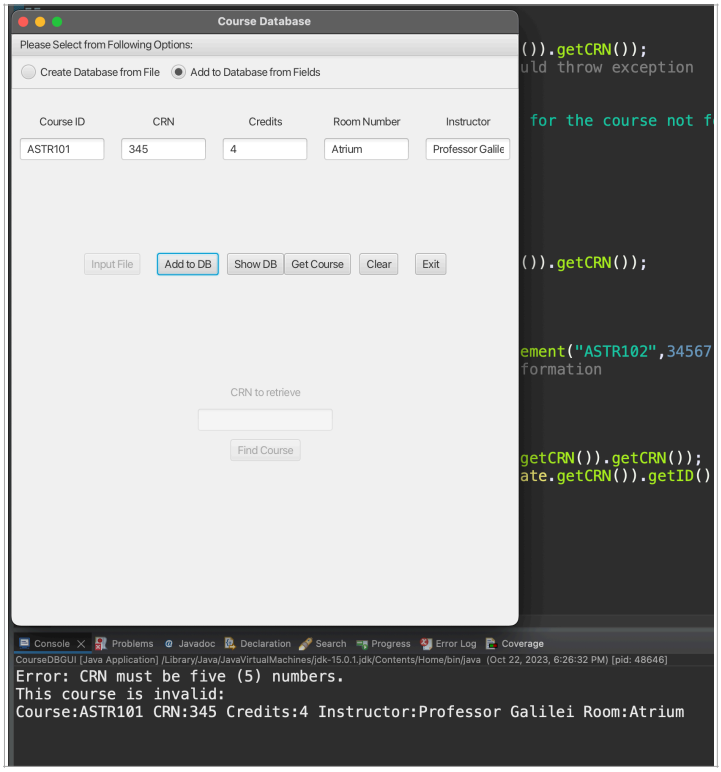
Test Runs:



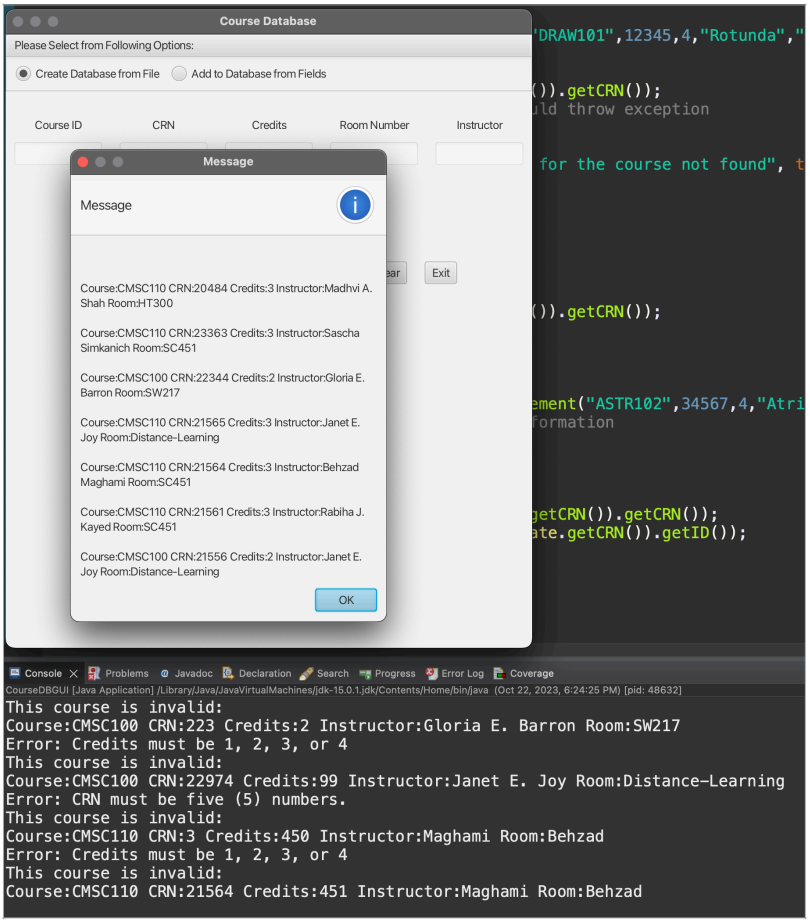
Two Elements are added to the hash table: ASTR101, 34567, 4, Atrium, Professor Galilei and DRAW101, 12345, 4, Rotunda, Professor DiVinci. The Show DB output is identical.



The Retrieve CRN feature is tested. CRN 34567 is entered and the correct ASTR101 Element is retrieved.



Data validation is tested in this case. An incomplete CRN is inputted, the console displays an error message and quietly ignores the entry until a 5-digit CRN is inputted.



An error-riddled text file of classes is inputted into the Create DB from File feature. Data validation is used on every field. Correctly formatted entries are inputted into the hash table and displayed. Incorrectly formatted entries are kept out of the table and displayed in the console with corresponding error messages to they can be fixed.
